Catch application mistakes before they reach your team

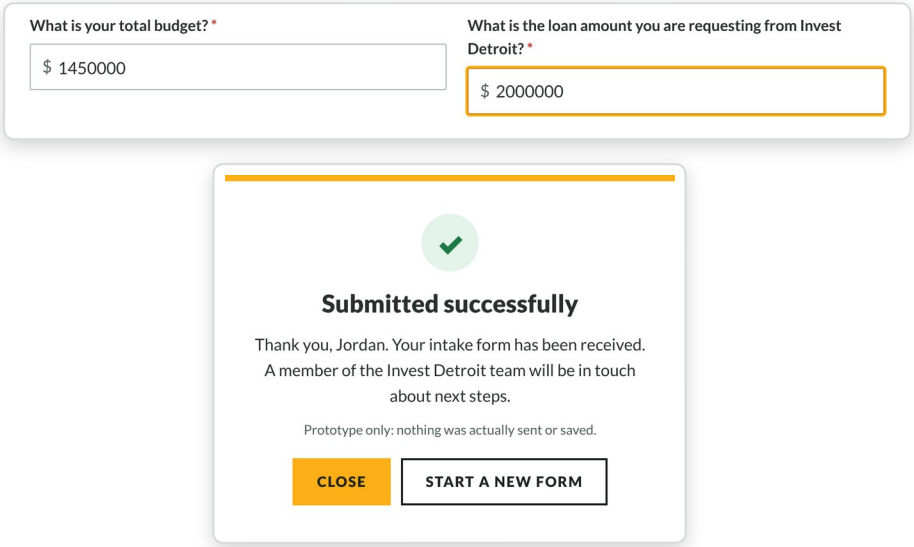

An AI Application Copilot for the Real Estate/C&I In-Take Form

[Team name] · Ross School of Business · [Date]

Today: mistakes are found too late

TODAY

Same example: a $2M loan on a $1.45M budget is accepted without a warning.

A long form with no save

48 required answers, and leaving the page loses everything.

Mismatches go through

It only checks blanks and formats, so numbers that contradict each other aren't caught.

Staff find the gaps later

Missing or unclear answers mean follow-up emails before screening can start.

Who it’s for

Applicants

- Developers and business owners applying for Real Estate or C&I financing
- First-time and emerging developers who are new to lending terms
- Applicants more comfortable in Spanish, Arabic, Bengali or Chinese

Invest Detroit lending staff

- The team that screens new intake forms
- Receives applications with fewer gaps and contradictions
- Sees an applicant’s note when a flagged answer is actually correct

How it works, in four steps

1. Prepare

“Before you start” lists the 3 documents and numbers to gather.

2. Fill in

Each answer is checked as you leave it; ? explains any question.

3. Review

One button checks everything. Fix it, or explain why it’s right.

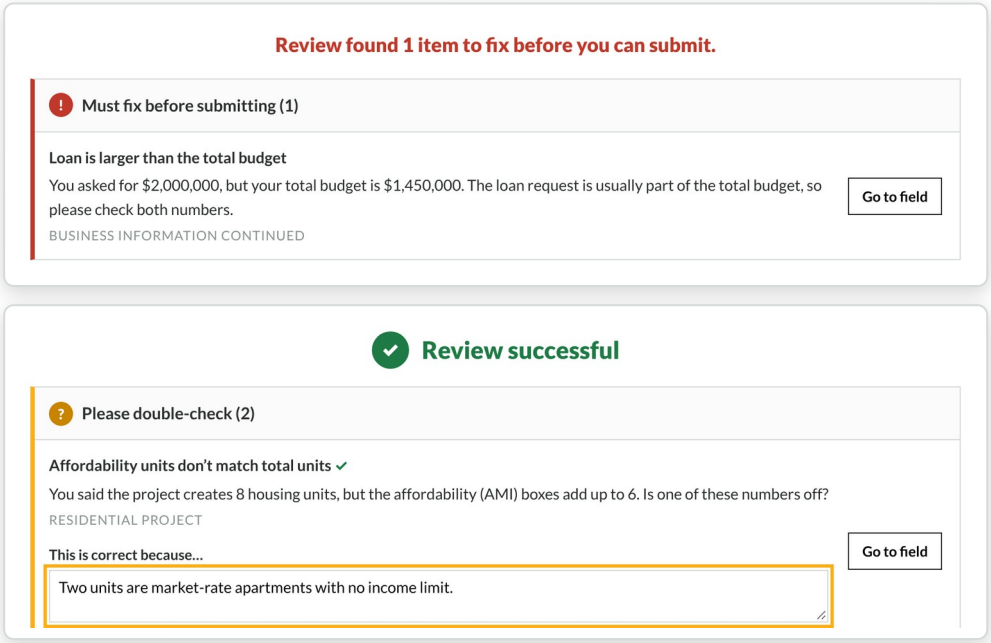

4. Submit

Unlocks after a successful review, then shows what happens next.

Built as an add-on for your FormAssembly page: one line of code, the form itself is unchanged, and if the add-on fails the form works exactly as today. Nothing applicants type or upload is stored.

Review My Application catches it

WITH THE COPILOT

Grouped by urgency

"Must fix", "Please double-check" and "Good to know", each with Go to field.

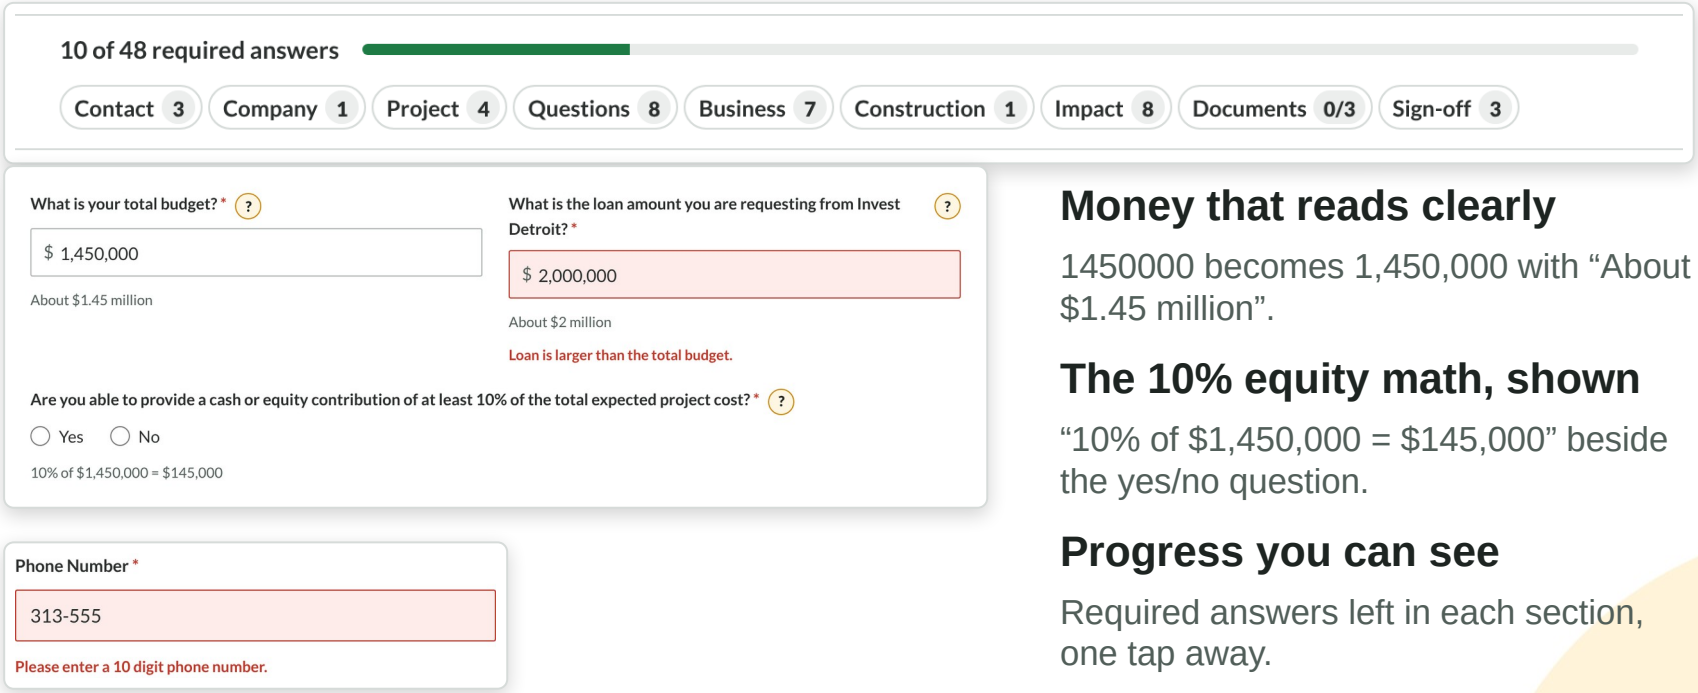

Explain instead of change

If an answer is right, the applicant adds a short note for your team.

Only clear errors block

Submit unlocks once nothing must be fixed. Tips never block.

Mistakes caught as they're typed

Money that reads clearly

1450000 becomes 1,450,000 with "About $1.45 million".

The 10% equity math, shown

"10% of $1,450,000 = $145,000" beside the yes/no question.

Progress you can see

Required answers left in each section, one tap away.

An assistant that knows its limits

From your own documents

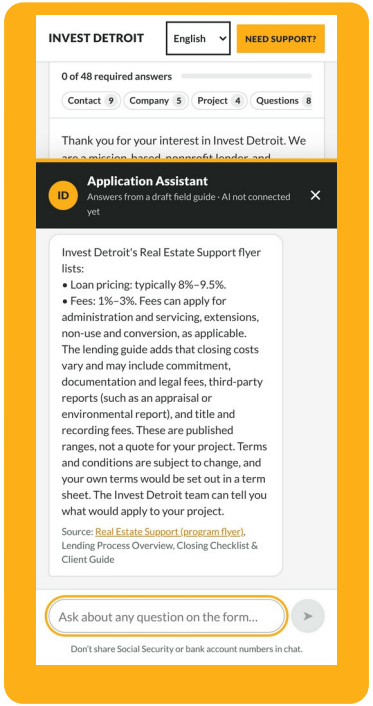

Program flyers, lending guide and official sources, always named.

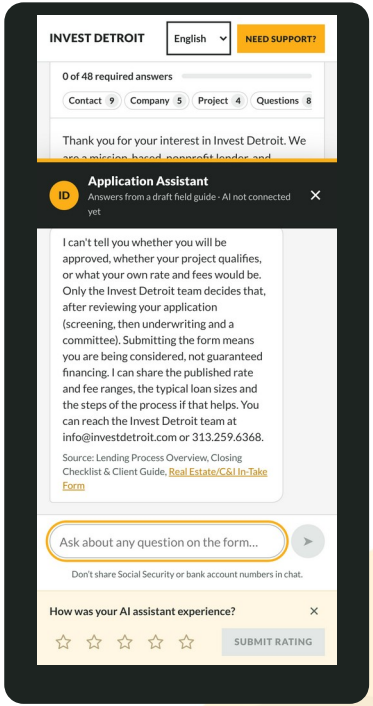

Never predicts approval

Published rates are quoted “subject to change”; decisions stay with staff.

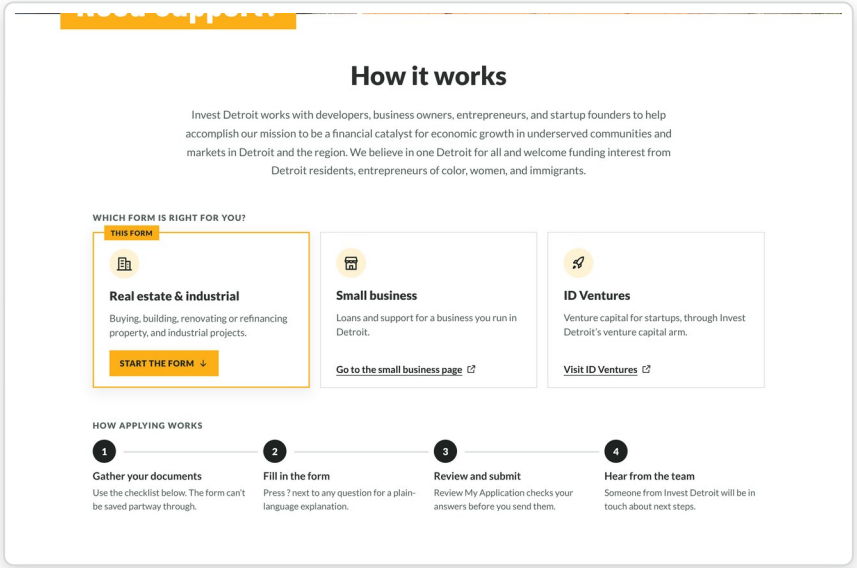

Guardrails built in

Stays on topic, won’t help falsify answers, hides Social Security numbers.

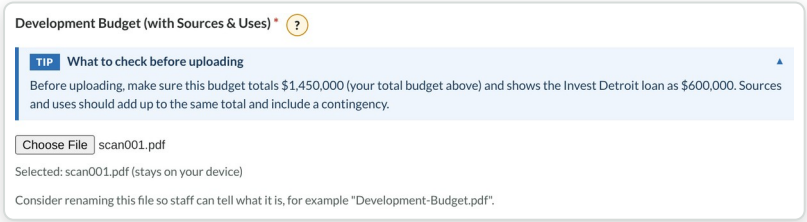

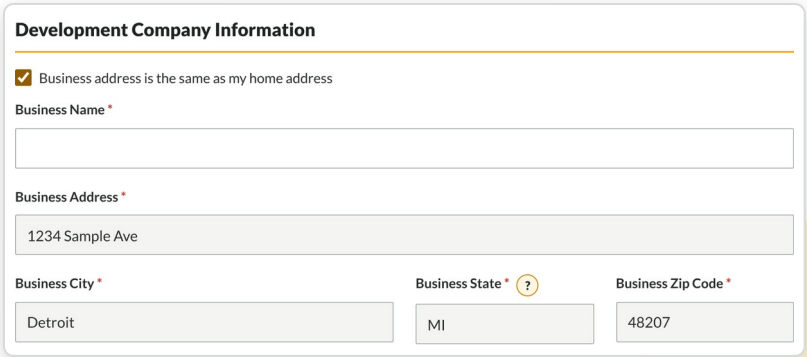

Smaller changes that add up

Clear start: which form fits, and the steps of applying

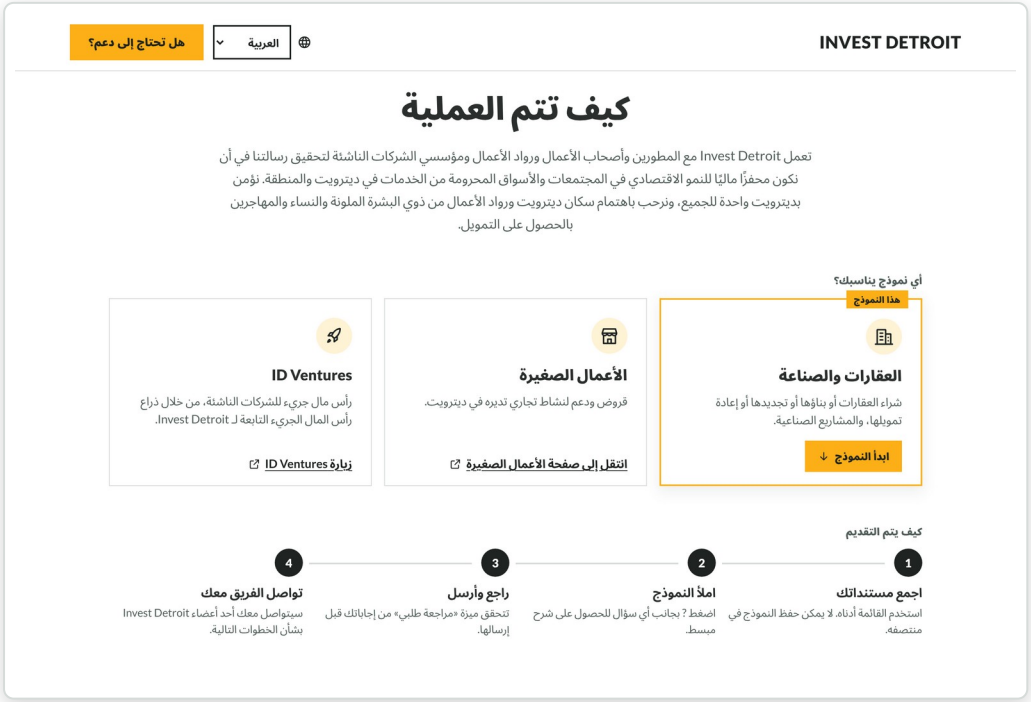

Upload tips and file checks, without opening files

Same-as-home address; state from ZIP

Five languages, every screen

English | Español | العربية | বাংলা | 简体中文

Written translations

Questions, review messages, tips and the page itself; Arabic reads right to left.

Answers stay in English

Switching language never changes what your team receives.

Mistakes caught before submitting

2/10

caught by today's form

10/10

caught with the copilot

Same example application, one mistake each	Today	Copilot
Required question left blank (job title)	✓	✓
Email address mistyped	✓	✓
Loan request larger than the total budget	—	✓
Total budget missing zeros ($1,450)	—	✓
Affordable-unit counts don't add up to housing units	—	✓
Net square footage entered larger than gross	—	✓
"Yes" to 10% equity, but the loan is 95% of the budget	—	✓
Owner counts don't match number of owners	—	✓
Mixed-use project with the office section left blank	—	✓
One-line executive summary	—	✓

Measured by running the same 10 example applications through the official form's own Submit checks (as copied in our replica) and through the copilot. Each example has one mistake taken from our field guide's common mistakes; how often each happens in real applications isn't known yet.

How well it works

10/10

example mistakes caught before submitting

160

automated checks pass on every change, including questions from your documents

79

help entries, each citing an Invest Detroit or official source

0

applicant files opened or stored; only an anonymous star rating is saved

Not yet measured: time saved per application and fewer follow-up emails. Those need a pilot with real applicants (see recommendation).

What it can’t do (yet)

Decide eligibility or approval

It never predicts approval or a rate; it points applicants to your team.

Read uploaded documents

Files are checked by name and size only, by design, for privacy.

Answer anything unexpected

Without an AI model connected it matches keywords; unusual questions get your contact details.

Replace a translator

Translations were drafted with AI and need a qualified reviewer. Chat answers are English only.

Stay current on its own

Rates and facts are copies of your flyers; they must be updated when a flyer changes.

Run on your site today

The add-on is built and tested on a copy of your form, but isn’t installed yet.

Our recommendation: run a short pilot

1

Check our facts

Staff review the help text, the rates we quote and the translations, and confirm which pricing sheet is current.

2

Pilot the add-on

Install the one-line add-on on the live Need Support page for a trial period, with your web team’s approval.

3

Measure the difference

Count incomplete applications and follow-up emails before and during the pilot: the real impact number.

4

Then decide on AI

If the pilot helps, add a notes field to FormAssembly and consider an approved AI model for open questions.

Thank you
